Beyond Standard Model Searches

Probing the nature of dark matter, neutrinos, and fundamental symmetries.

- Galactic sources: dark matter (WIMPs, dark photons, axion-like particles)

- Solar sources: axions, neutrinos

- Detector as source: neutrinoless double beta decay

- Accelerator beam sources: muon decay ($\mu \to e\gamma$), neutrinos

Liquid xenon time projection chambers *(underground!)*

Today's talk

- Dark Matter - Weakly Interacting Massive Particle (WIMP) searches have motivated the detector development

- Liquid xenon (LXe) time projections chamber (TPCs) detection principle

- Probing dark matter beyond the standard WIMP

- Experimental status and future
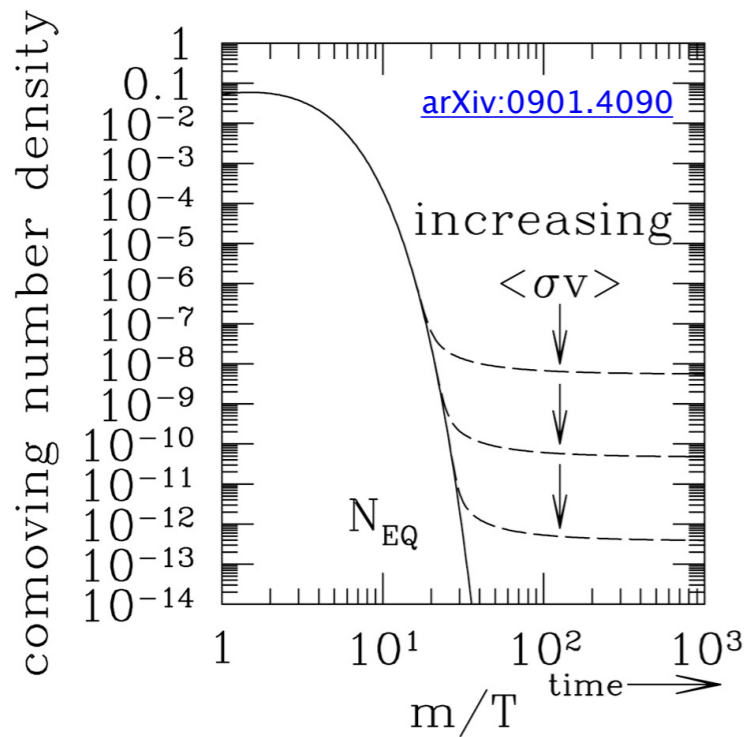

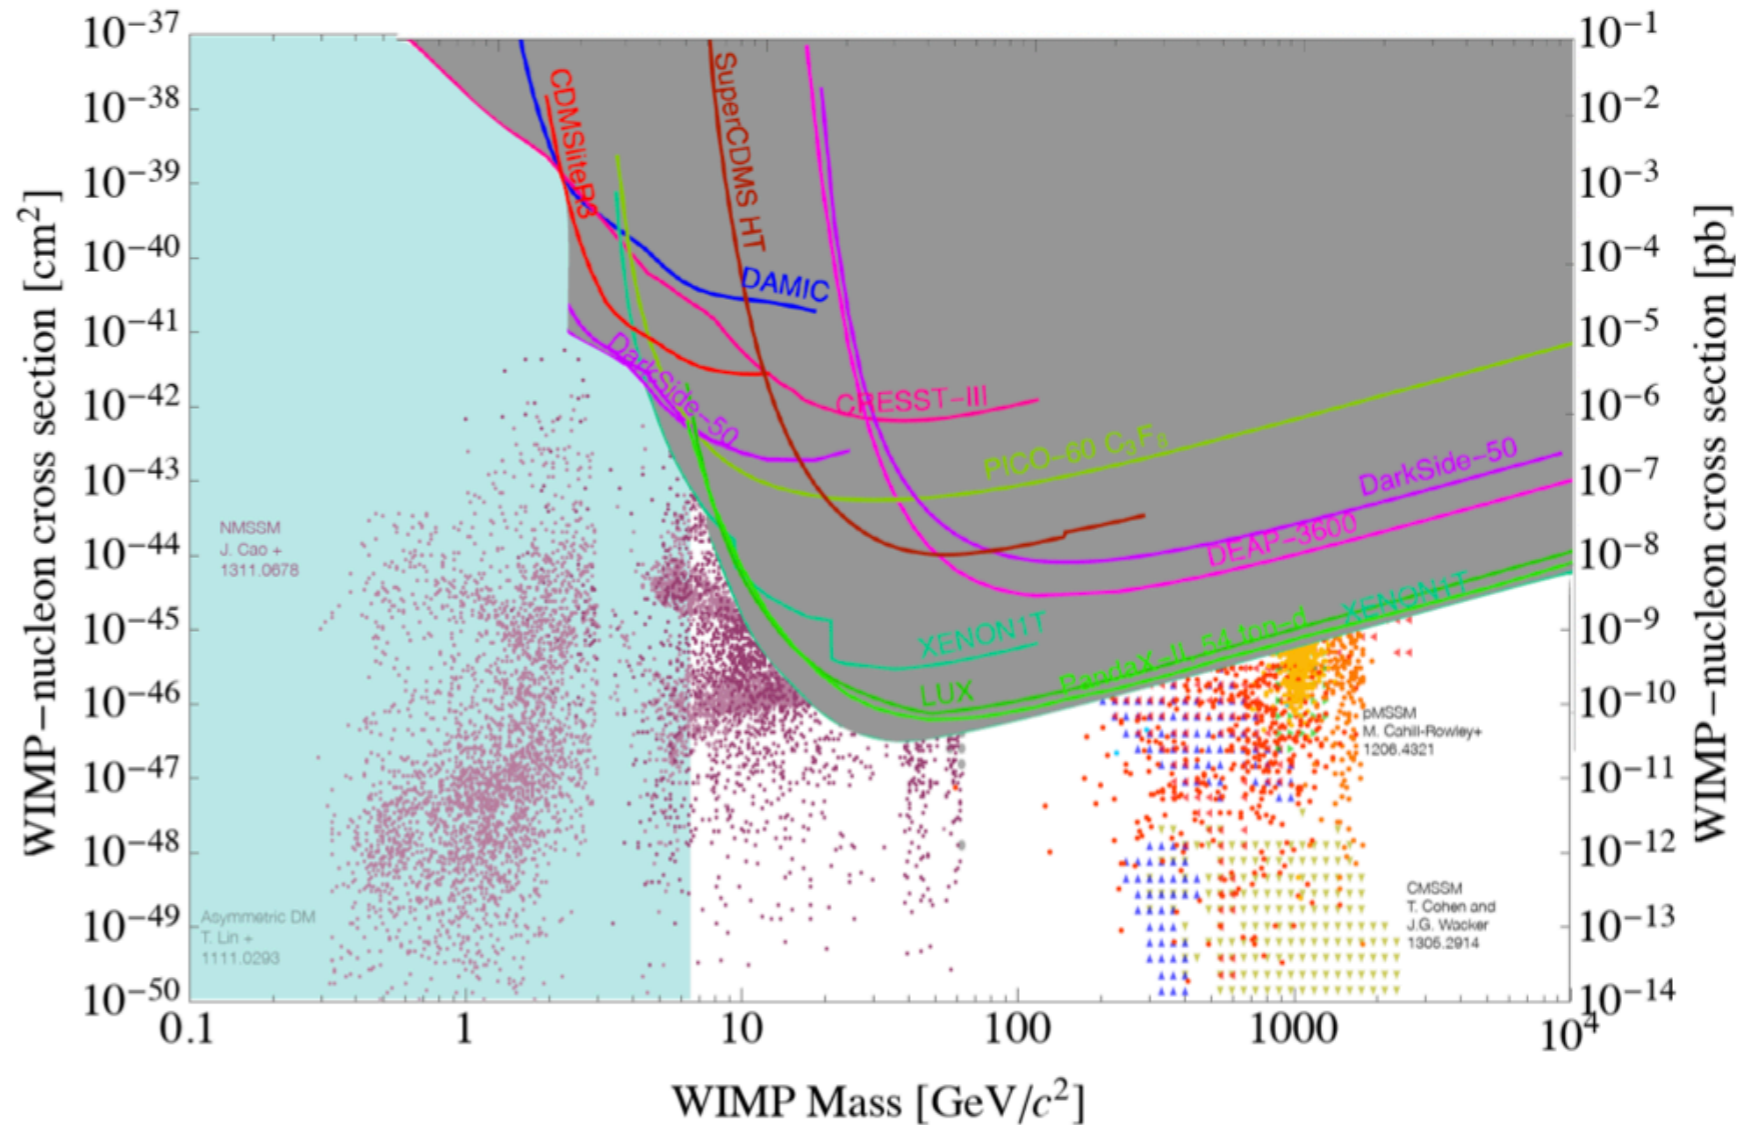

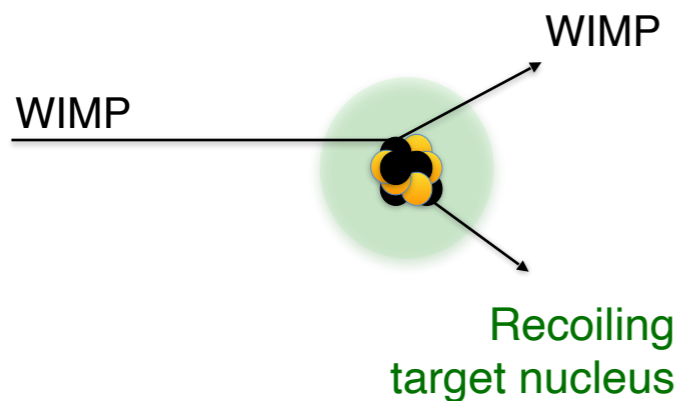

Dark Matter

WIMP

Recoiling
target nucleus

theory-driven search space for WIMP-nucleon
interactions

J. Cooley, arXiv:2104.07634 (2021)

- favoured by supersymmetry (Beyond Standard Model): new physics expected at these masses and with **weak-scale cross section** (thermal relic - "**WIMP miracle**")
- can look for elastic scattering of WIMPs off of target nuclei (quark level, mediated by Higgs or Z boson)

WIMP rates and parameter space
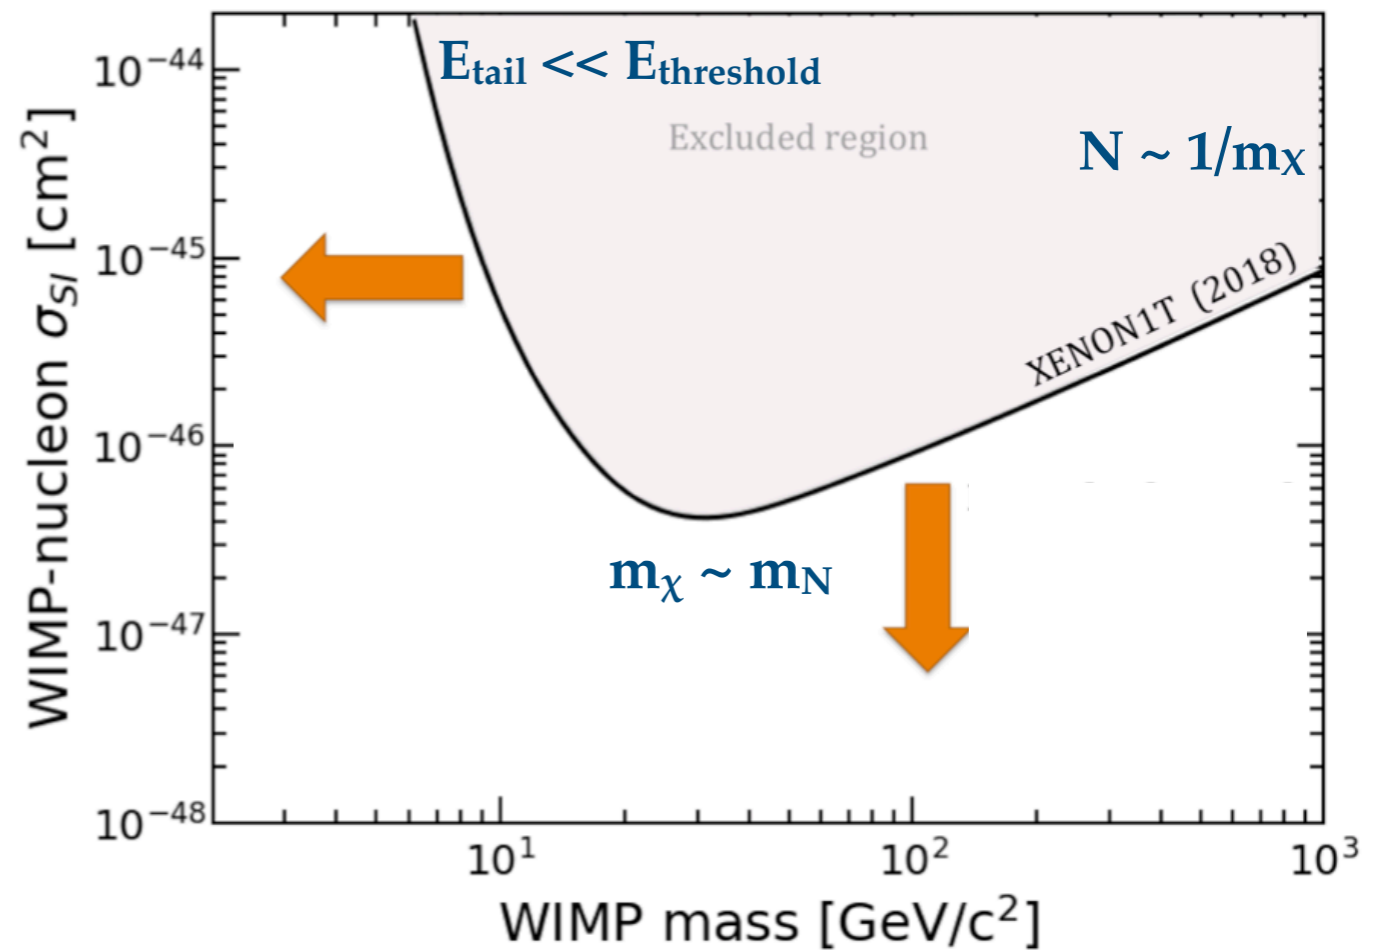

Expected differential event rate

Nuclear and particle physics

$$\frac{dR}{dE_r} = MT \times \frac{\rho_0 \sigma_0}{2 m_\chi m_r^2} F^2(E_r) \int_{v_{\min}} \frac{f(\vec{v})}{v} d^3 v$$

Detector

Astrophysics

WIMP masses in the range of 10 - 1000 GeV c^{-2} typically yield recoil energies of 1 - 100 keV.
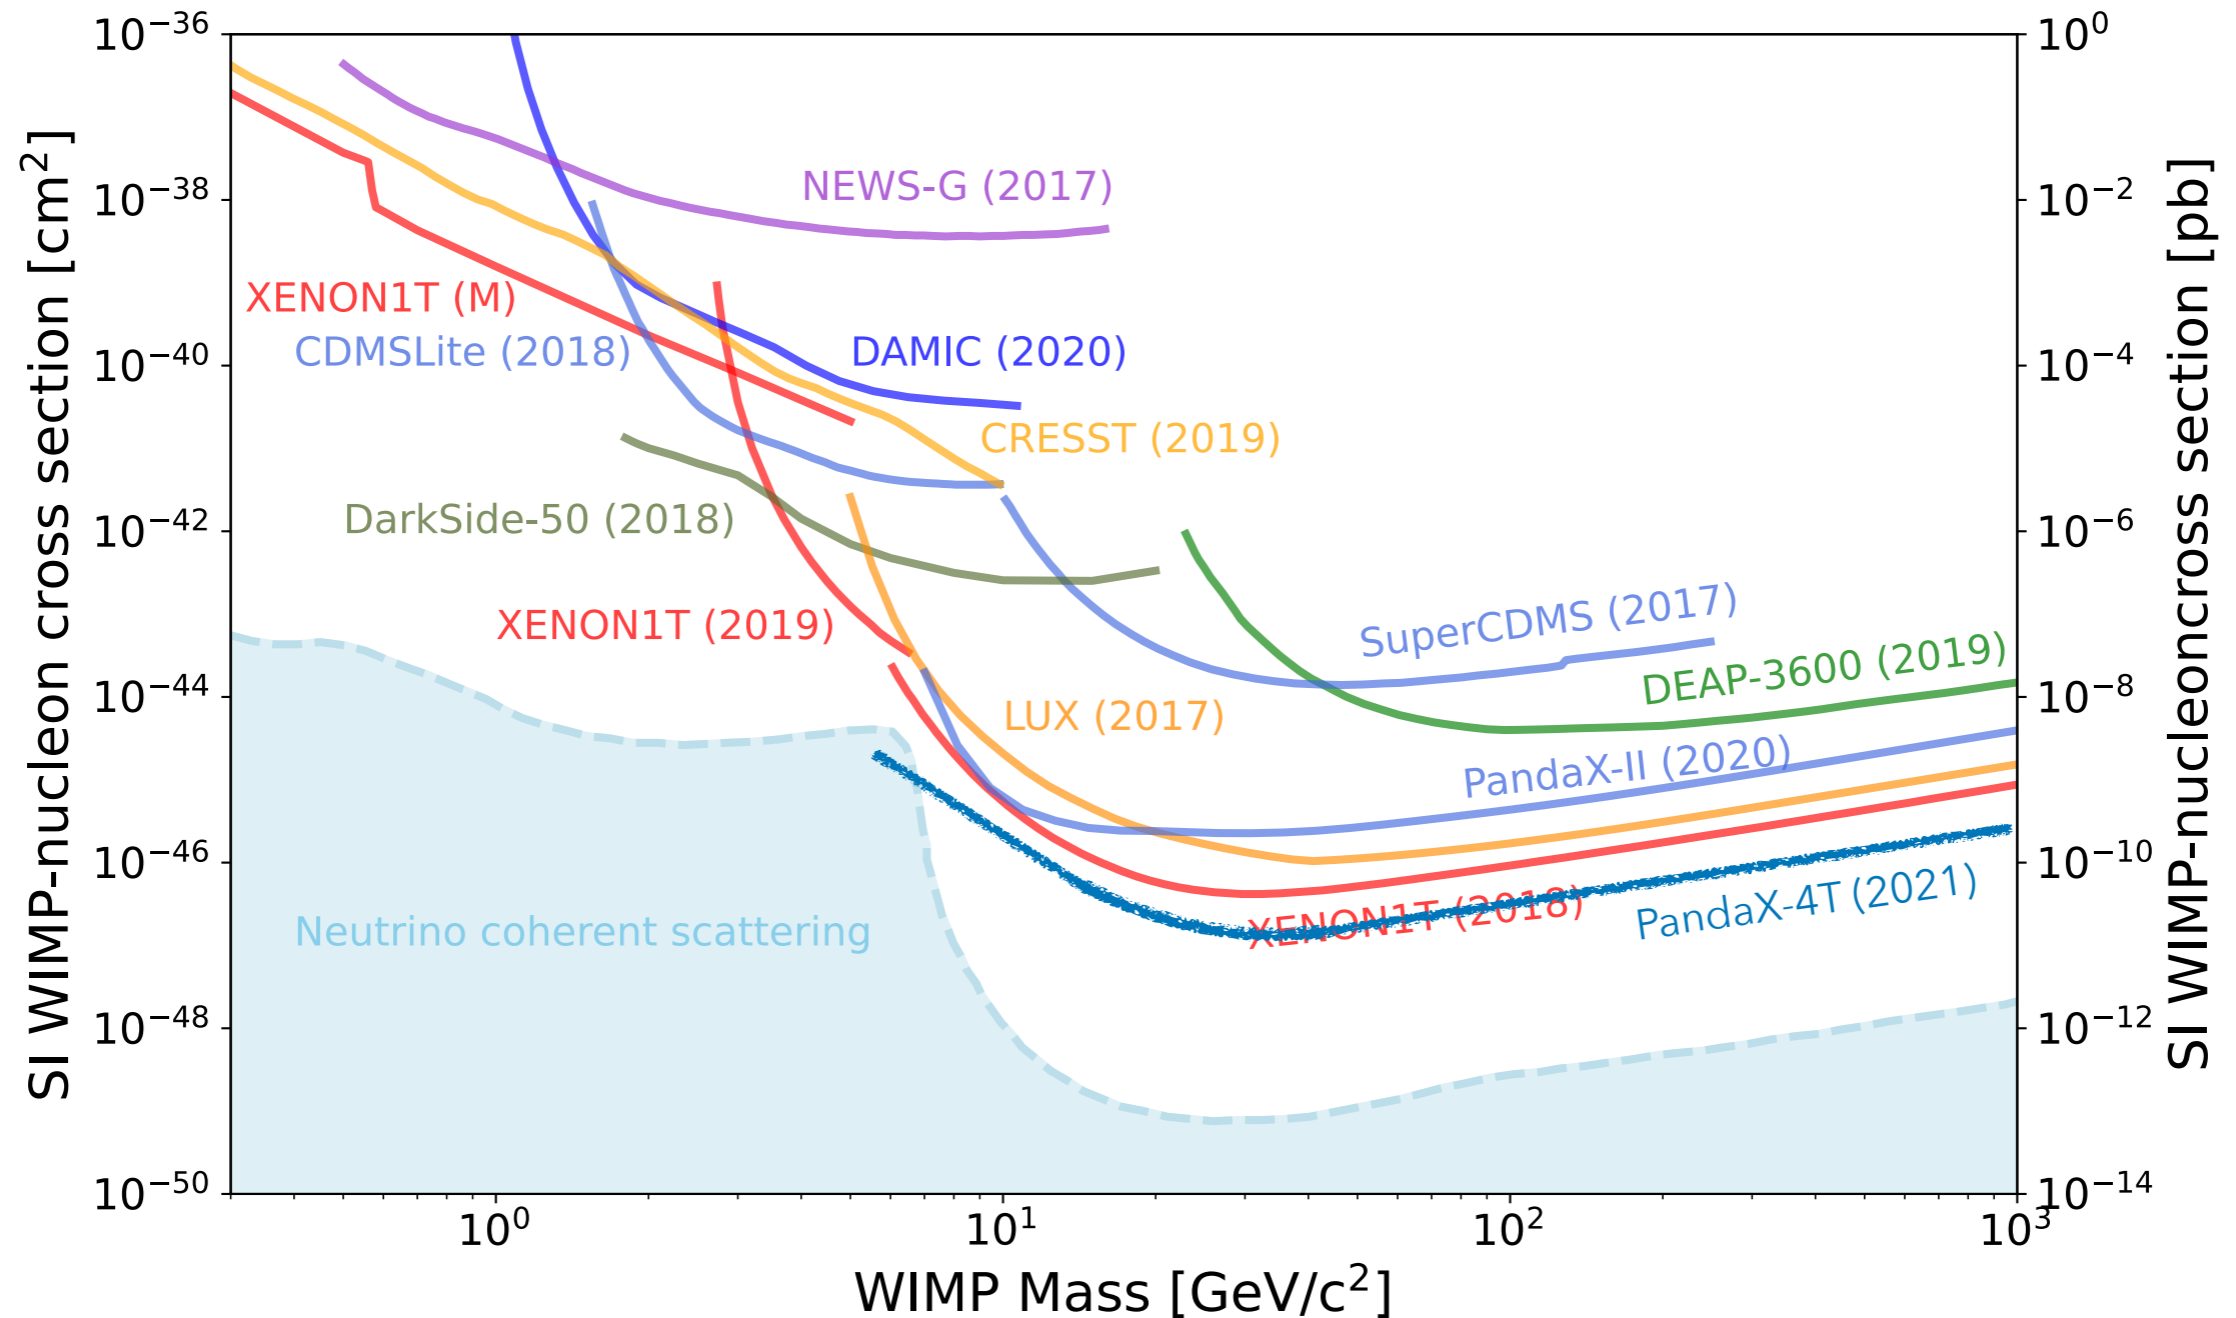

Dependencies:
target atom (detectability of recoil energy)
detector effects (threshold, efficiency, resolution)

NR-WIMP cross section vs mass

increase exposure
lower background
discrimination power (PID)
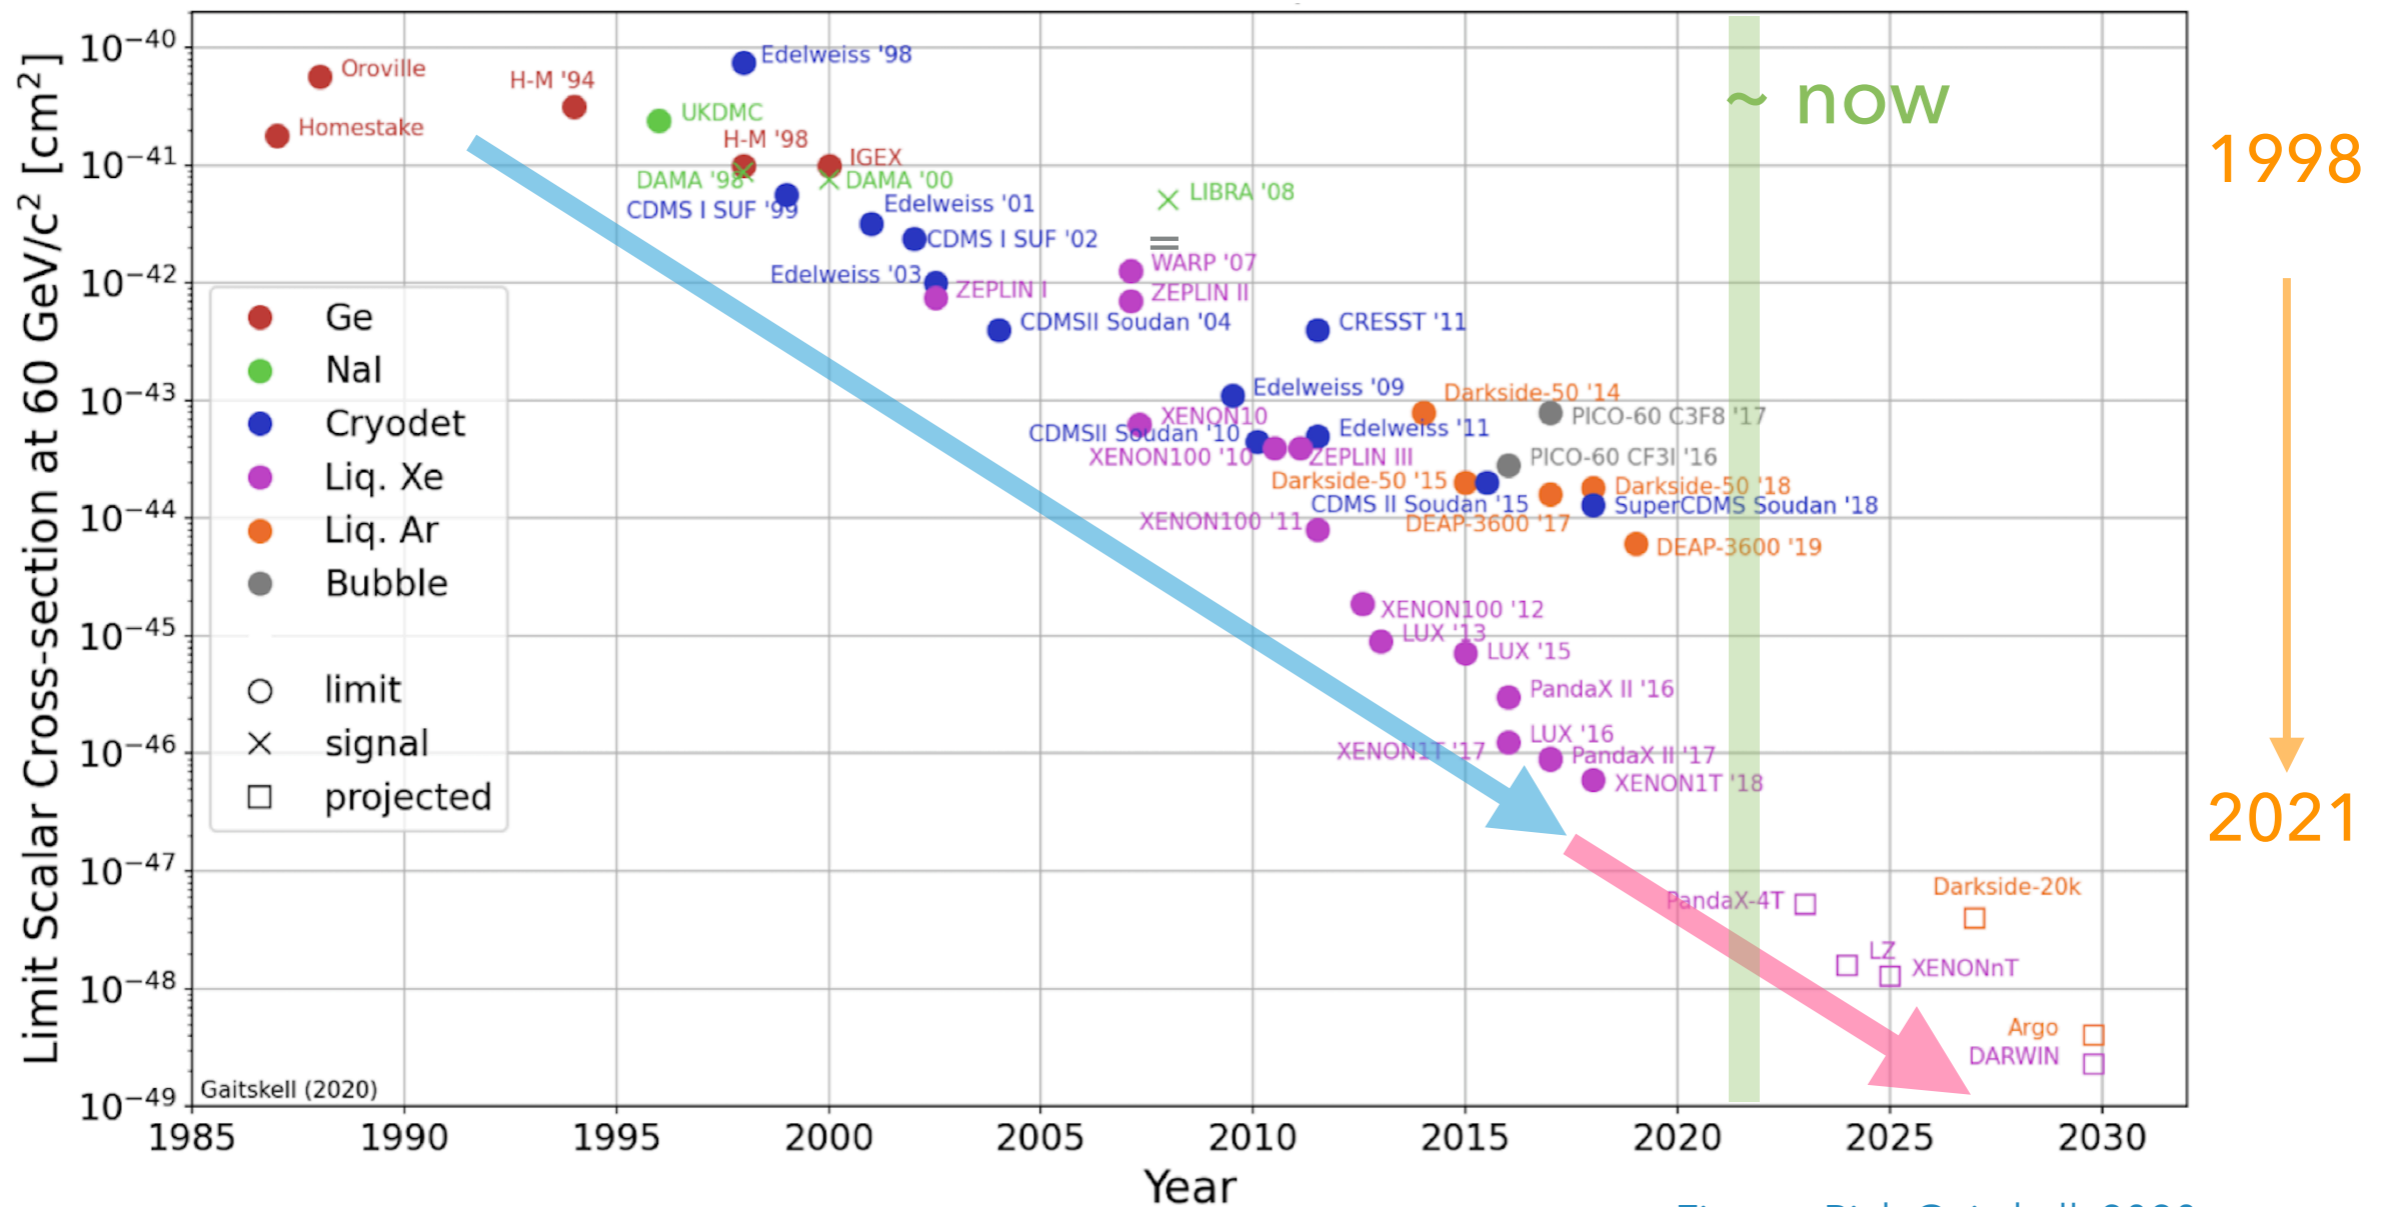

Current limits: spin-independent WIMP

Past, present, future

Spin-independent cross section upper limits at 60 GeV WIMP mass

Particle discrimination

Electronic Recoils (ER)
gamma, beta backgrounds;

*neutrino physics, solar axions, bosonic dark matter*

Nuclear Recoils (NR)
neutron background;

WIMPs, coherent neutrino scattering

XENON1T achieved
< 100 events/(t/yr/keV$_{ee}$)

Discriminate NR from ER events; candidates above small neutron and instrumental backgrounds.

Search for excess above known, well-modelled ER backgrounds.

XENON Collab., PRL 121, 111302 + PRL 123, 251801

Extending the search range

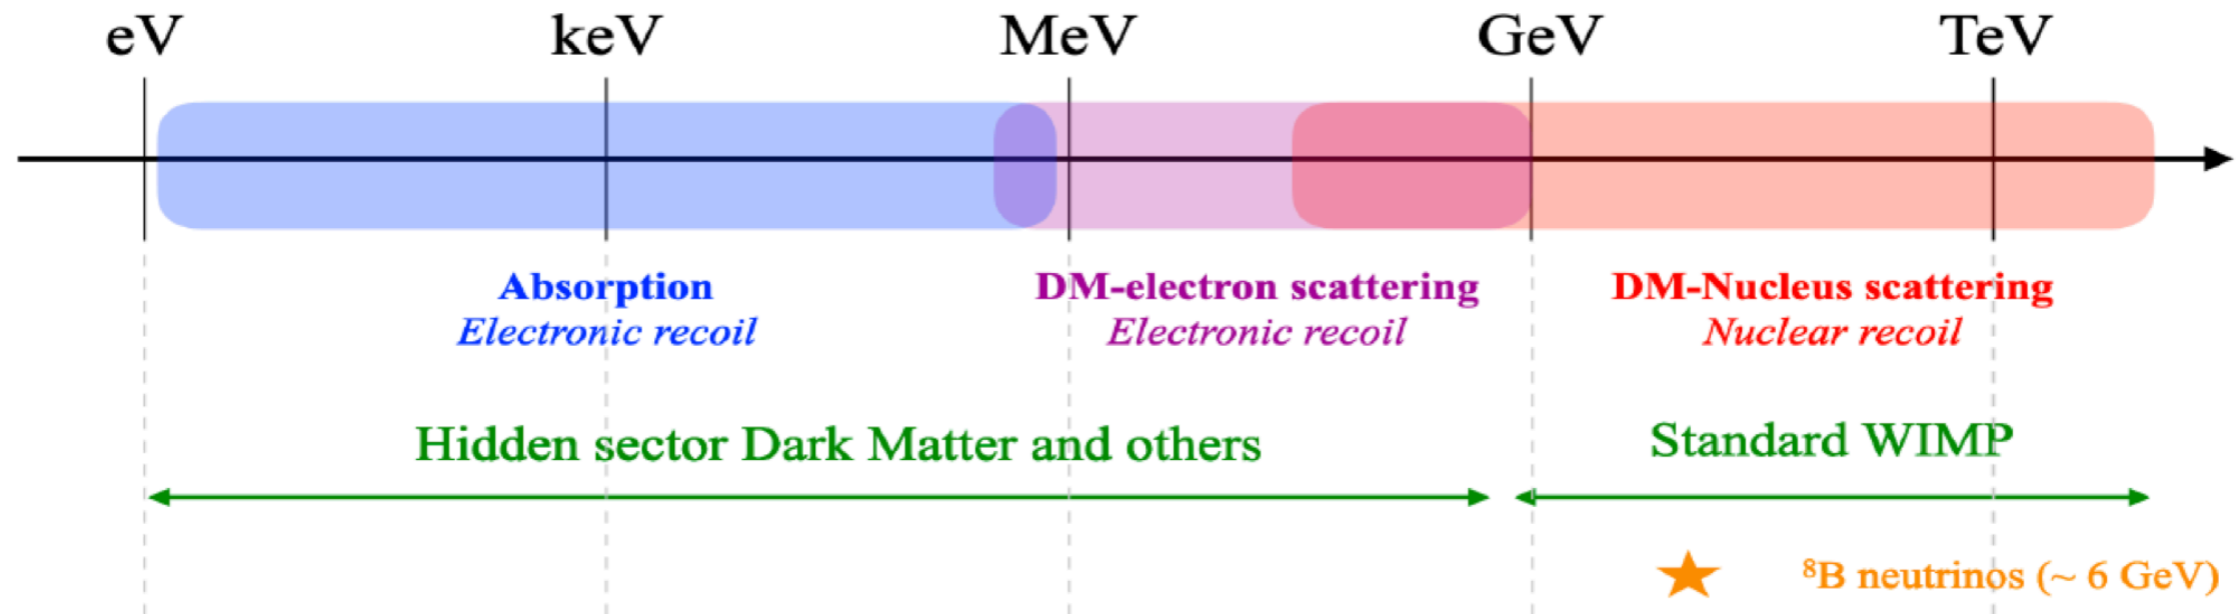

J. Cooley, arXiv:2104.07634 (2021)

Nuclear recoil: the threshold is statistically limited by the prompt scintillation signal (S1):
- Lower the 3-fold PMT coincidence requirement to 2-fold
- Drop the S1 and use the ionisation (S2) only channel for limit setting

Electronic recoil:
- Set S2 limits assuming electronic recoils (no discrimination)
- Use S1, S2 anti-correlation and combine them (better event statistics)
- Reduce and model the ER backgrounds
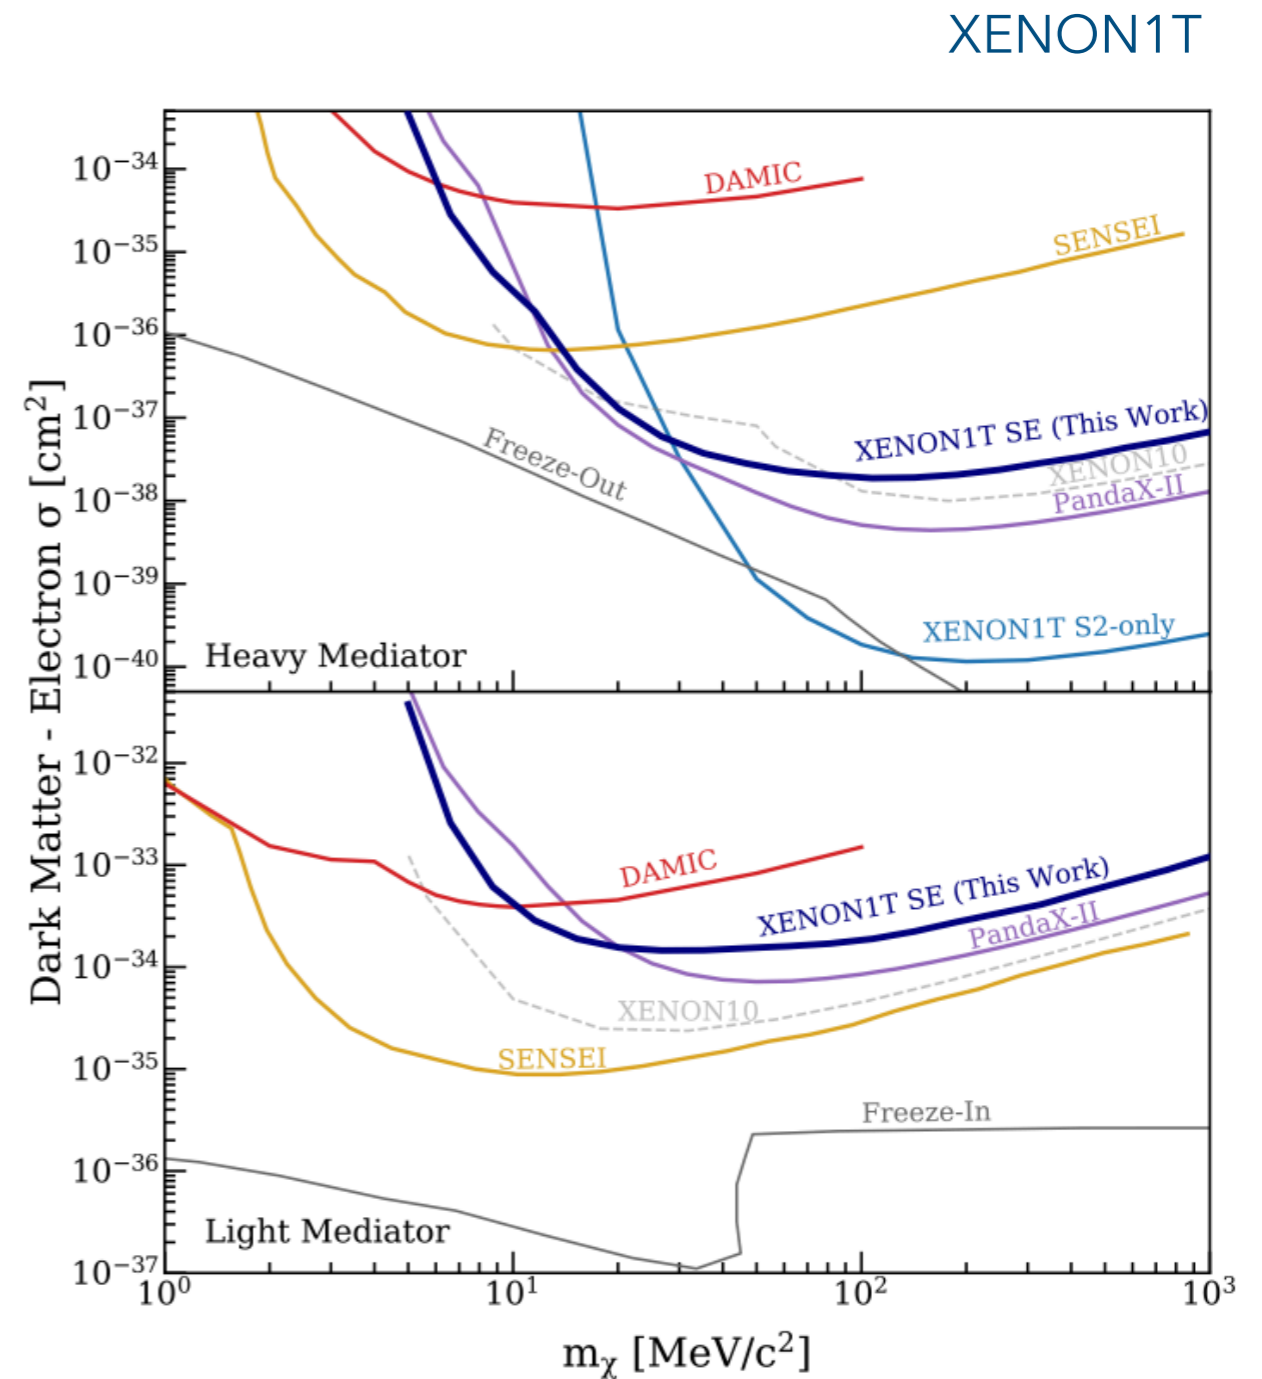

DM-nucleon: lower thresholds
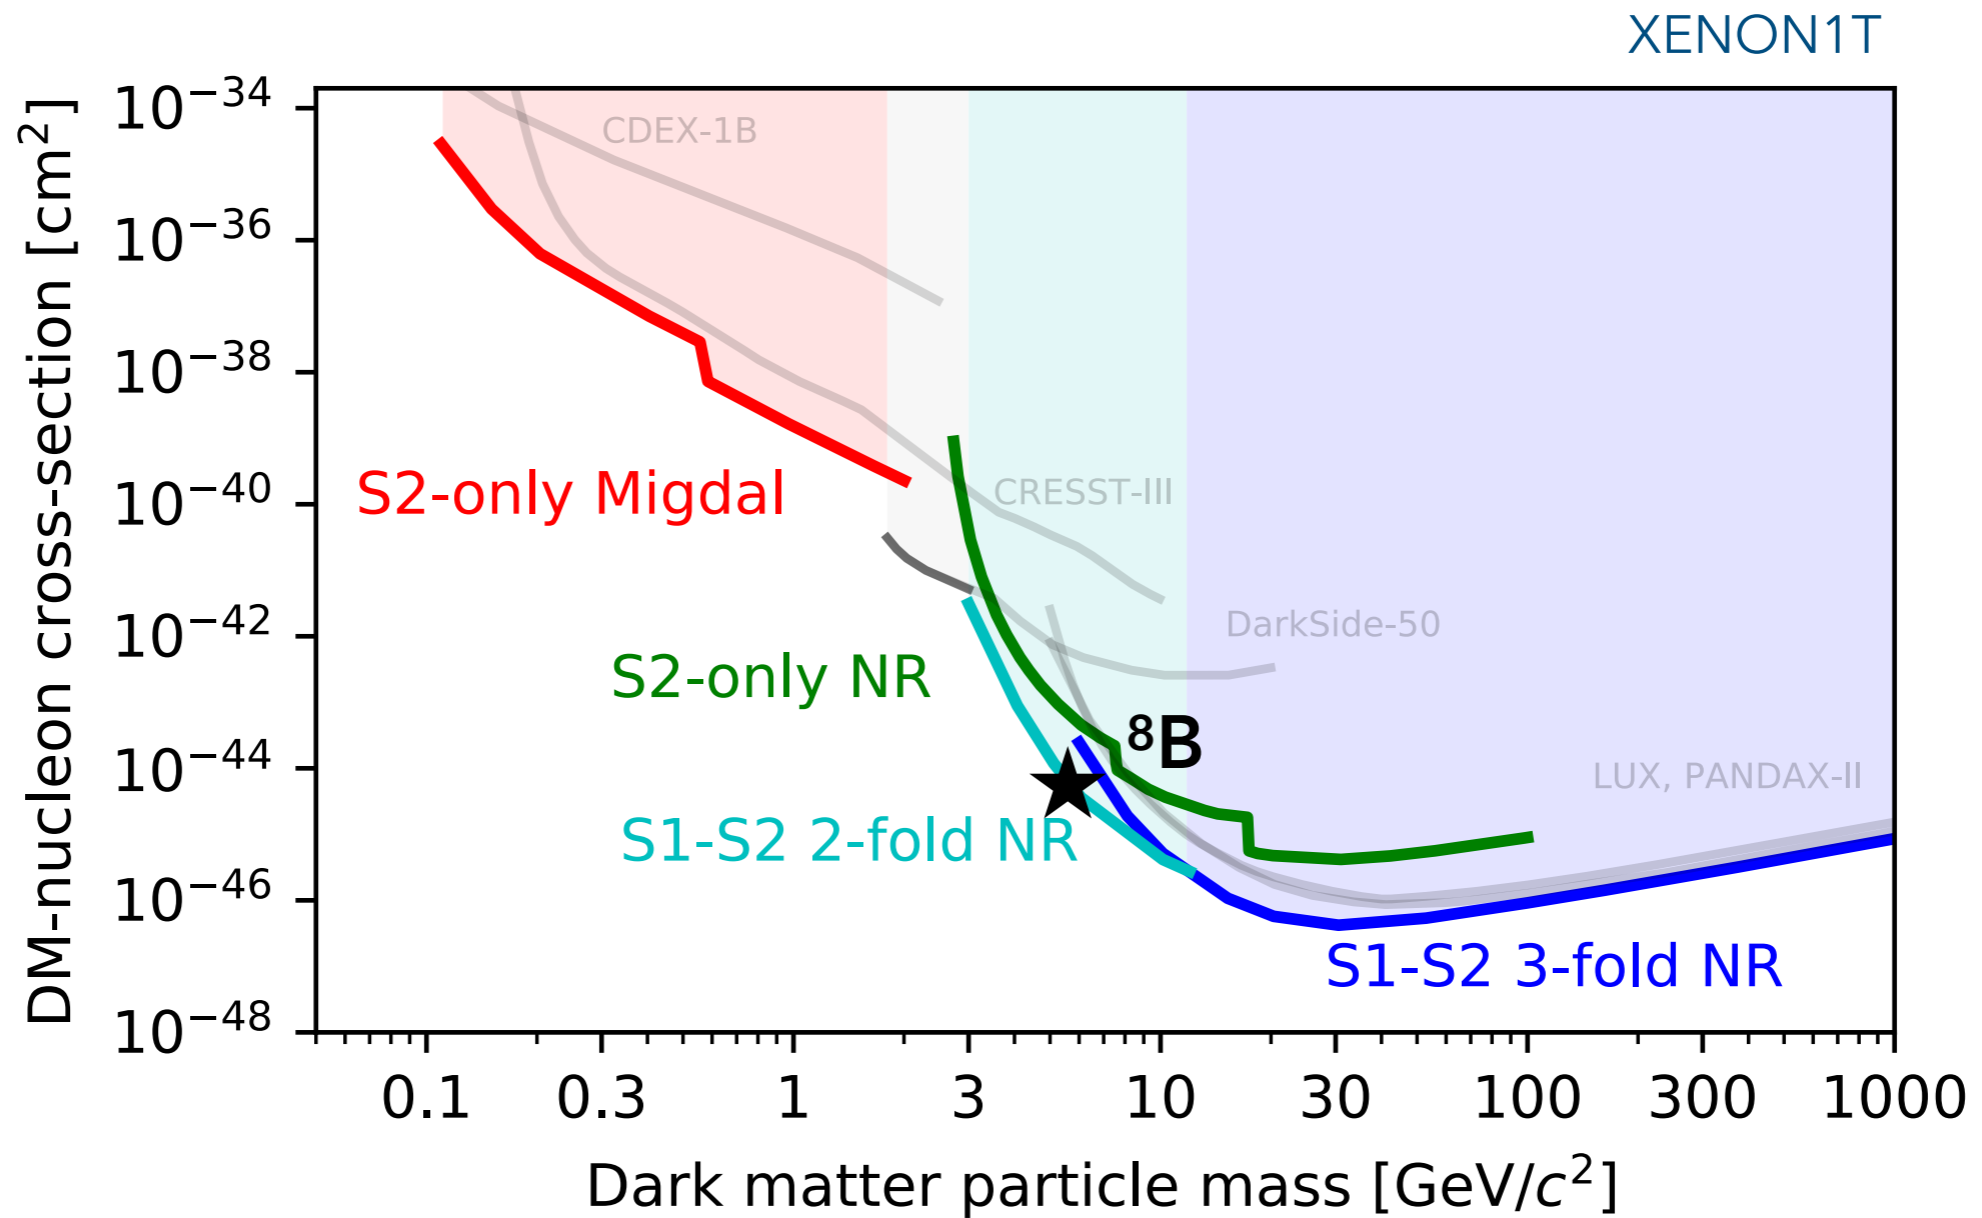

Can also look for secondary emission (Migdal effect) in S2-only data.
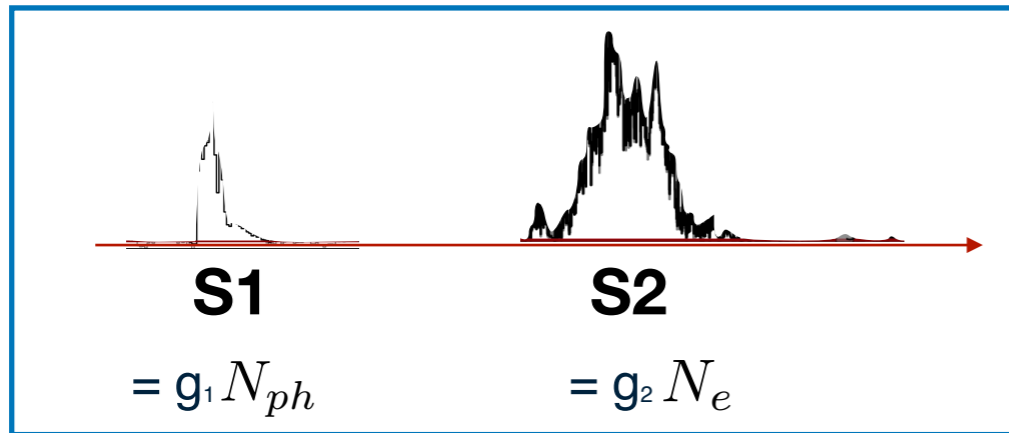

13

DM-electron: S2-only

PandaX-II

XENON1T

14

Electronic recoil: energy scale

S1 $= g_1 N_{ph}$
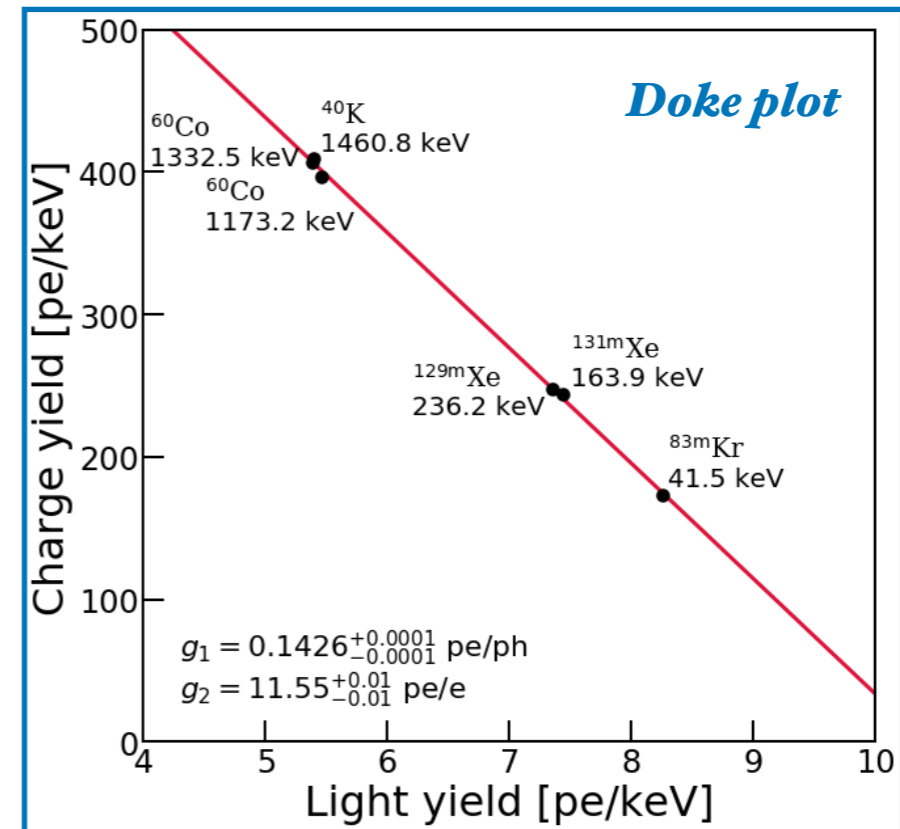

S2 $= g_2 N_e$

$$E = (N_{ph} + N_e) \cdot W$$

with W = 13.7 eV/quanta for xenon

g₁ and **g₂**:

detector-specific gain constants;
extract g_1/g_2 from calibration data

Doke plot

$$g_1 = 0.1426^{+0.0001}_{-0.0001} \text{ pe/ph}$$
$$g_2 = 11.55^{+0.01}_{-0.01} \text{ pe/e}$$

$$\frac{S2}{E} = -\frac{g_2}{g_1}\frac{S1}{E} + \frac{g_2}{W}$$

g₁ and g₂ are used to reconstruct
energy of each event

$$E = \left(\frac{S1}{g1} + \frac{S2}{g2}\right) \cdot W$$
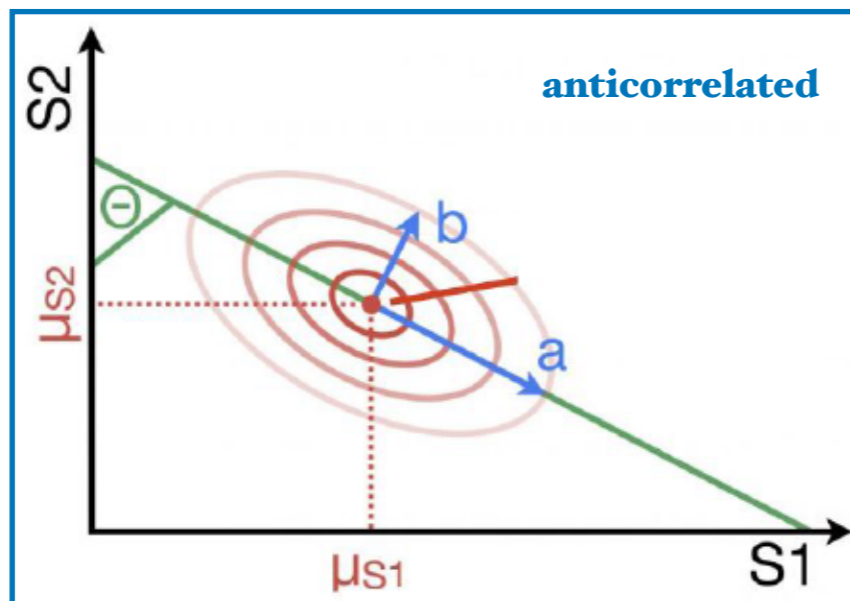

Electronic recoil: backgrounds

Background model B$_0$

Partitioned into two datasets and fit simultaneously

SR1$_a$: activated backgrounds, peaks

SR1$_b$: allows to constrain the dominant ^{214}Pb background at low energies

- Unbinned profile likelihood
- Likelihood of 2 partitions combined

Test statistic q for inference

$$q(\mu_s) = -2\ln\frac{\mathcal{L}(\mu_s, \hat{\hat{\boldsymbol{\mu}}}_b, \hat{\hat{\boldsymbol{\theta}}})}{\mathcal{L}(\hat{\mu}_s, \hat{\boldsymbol{\mu}}_b, \hat{\boldsymbol{\theta}})}$$
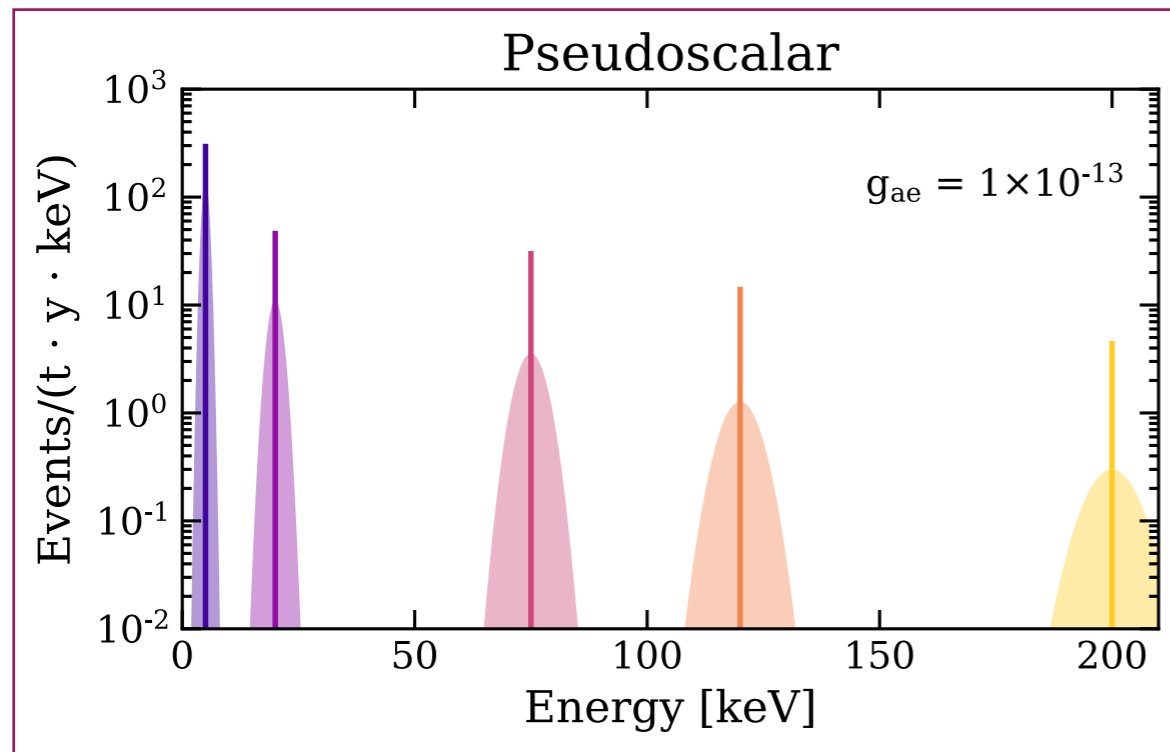

max. L with specified signal parameter μ_s

nuisance parameters that maximise L

Bosonic dark matter

Thermal DM, non-relativistic: deposited energy is rest mass of particle.
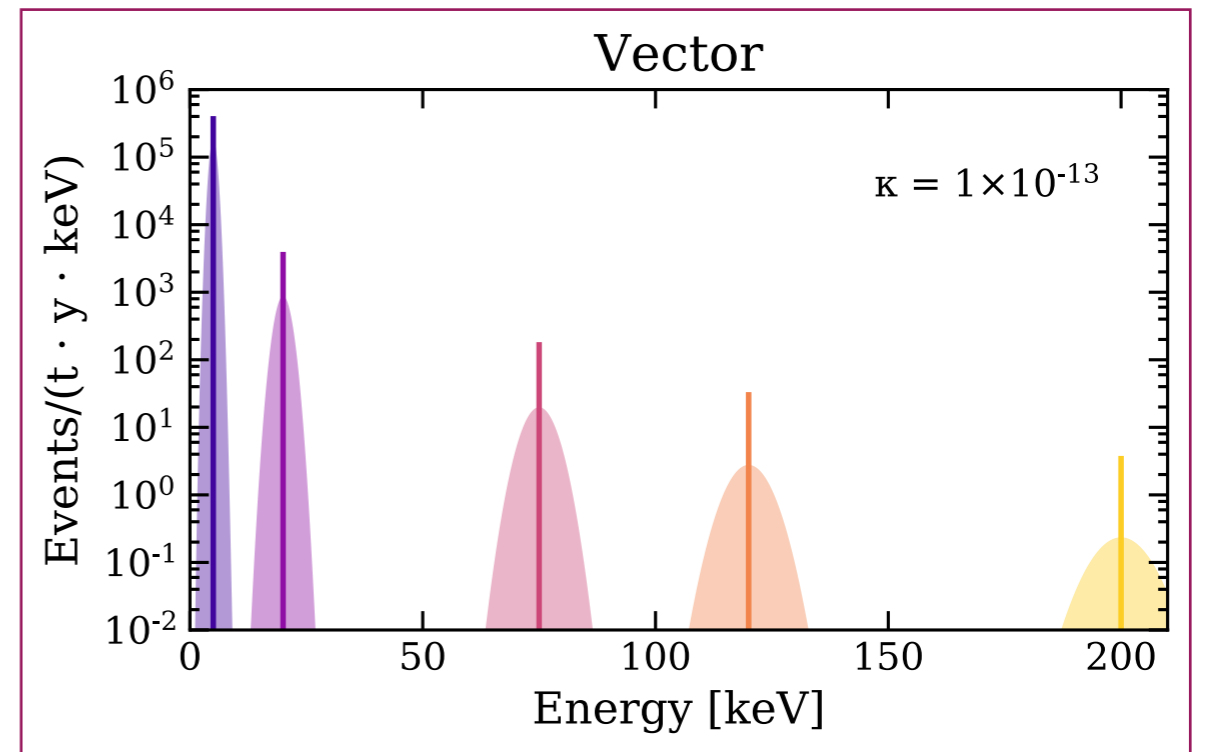

axion-like particles

dark photons

Pseudoscalar — $g_{ae} = 1 \times 10^{-13}$

Vector — $\kappa = 1 \times 10^{-13}$

$$R \simeq \frac{1.5 \times 10^{19}}{A} g_{ae}^2 \left(\frac{m_a}{keV/c^2}\right) \left(\frac{\sigma_{pe}}{b}\right) kg^{-1}d^{-1}$$

$$R \simeq \frac{4.7 \times 10^{23}}{A} \kappa^2 \left(\frac{keV/c^2}{m_V}\right) \left(\frac{\sigma_{pe}}{b}\right) kg^{-1}d^{-1}$$

Detection via axioelectric effect

Kinetic mixing with SM photons

$$\sigma_{ae} = \sigma_{pe} \frac{g_{ae}^2}{\beta} \frac{3E_a^2}{16\pi\alpha m_e^2} \left(1 - \frac{\beta^{2/3}}{3}\right)$$

$$\sigma_V \simeq \frac{\sigma_{pe}}{\beta} \kappa^2$$

The XENON1T excess

reference region 1-7 keV

XENON Collab., Phys. Rev. D 102, 2020

▸ Excess between (1,7) keV; number of observed events: 285, expected from background: (232±15) events

▸ Solar axion favoured over background-only at 3.4 σ (however discrepancy with stellar cooling constraints, see e.g. 2006.12487)

▸ Unknown origin: tritium, solar axions, ALPs, dark photons, something else?

Preliminary

fit

^{222}Rn α-decay

best fit equilibrium: (1.72 ± 0.03) µBq/kg

days since distillation start (intermediate mode)

- Reached equilibrium concentration of 1.72 µBq/kg by gas extraction only

- Background goal 1 µBq/kg

- Additional factor 2 in Rn removal possible via liquid extraction

XENONnT
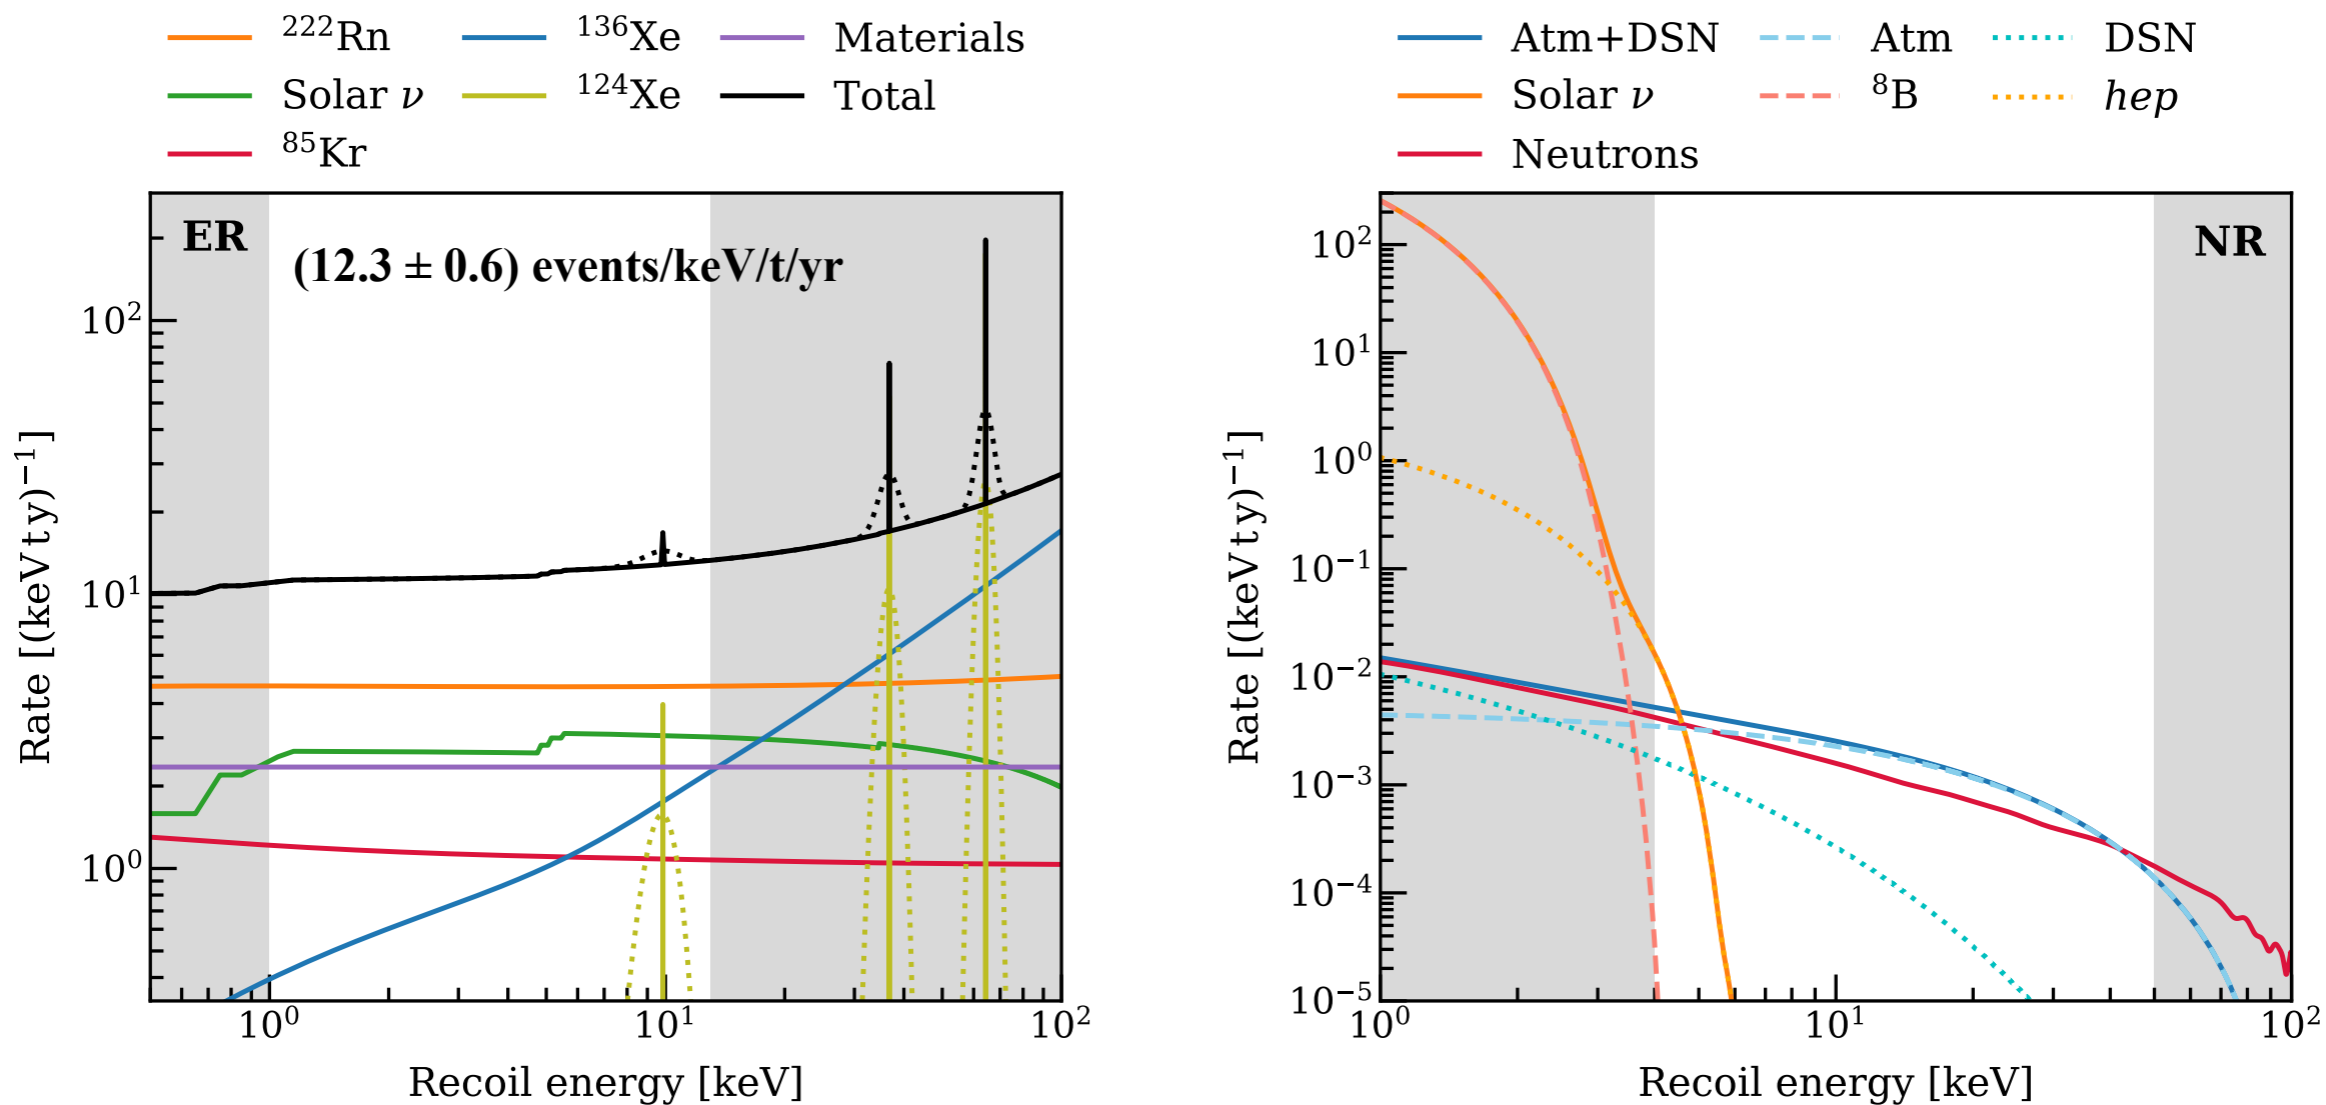

- Total ER rate reduced by factor six

- ER background for WIMP and axion search dominated by **^{222}Rn** (2νββ of ^{136}Xe above 30 keV)

- **Neutrino-dominated NR**: target < 1 neutron NR event per 20 t-yr target exposure
XENONnT: WIMPs

- Improve existing WIMP limits by more than one order of magnitude with 20 tonne-year exposure

- Discovery potential beyond 10^{-47} cm^2 for 50 GeV/c^2 WIMP in ~ one year live time

The future

DARWIN: 50 t LXe

- ‣ Future merger of DARWIN and LZ collaborations to build/operate next-generation liquid xenon experiment

  - ◉ new, stronger international collaboration

  - ◉ comes after LZ and XENONnT are done ~ 2026

- ‣ Paving the way now

  - ◉ first joint and very successful DARWIN LZ meeting April 26-27: https://indico.cern.ch/event/1028794/

  - ◉ MoU signed July 6, 2021: 104 research group leaders from 16 countries

  - ◉ Will combine expertise and technologies

DARWIN R&D

▶ Detector, Xe target, background mitigation, photosensors, etc

▶ Two large-scale demonstrators (in z & in x-y) supported by ERC grants: demonstrate electron drift over 2.6 m, operate 2.6 m ø electrodes

▶ Demonstrators (Xenoscope, 2.6 m tall & Pancake, 2.6 m diam TPCs) in commissioning stage

Test e⁻ drift over 2.6 m (purification, high-voltage): U. Zurich

Test electrodes with 2.6 m diameter: U. Freiburg

Fog on the horizon

O'Hare, Phys. Rev. Lett. 127 (2021) 251802

31

Mapping the fog

discovery limit scales as N events increases

through the fog, spectral differences should be come apparent.

Summary

- Over two decades of WIMP searches have covered more than 6 orders of magnitude in cross-section vs mass parameter space.

- LXe TPCs, driven by standard WIMP searches, have reached exceedingly low backgrounds, thus opening new detection channels.

- A new generation of multi-ton scale detectors are now taking science data, already with first results.

- Competition gives way to collaboration in the future, and R&D for the ultimate LXe detector is underway.

- An inevitable neutrino fog is on the horizon, but patience may bring clarity.

Thank you for listening!
